Assignment

The language of Business Analytics

Terms used across Business Analytics

① **Business Analytics** — focuses on business perspective of the data being analysed
is a process across industries were professional, collect, analyze, and interpret data to inform decisions and drive organizational performance.

Business analytics can be used to answer questions about what happened? Why did it happen? What might happen in the future? What should be done next?.

Example

In the retail industry, stores collect data through point-of-sales (PMS) which allow them to identify which products sell well and which do not. Taken the steps, business can forecast future demand and make informed decisions about inventory management.

② **Data Analytics** — work more closely with the data itself.
is the process of collecting, cleaning and analyzing data to discover patterns, trends, and insights.

Example

In retail store, like previous example. After collecting data, analysts, clean, analyze this data to identify patterns, such as which products are frequently bought, items sell the most, and sales trends over time. (focus on pattern and insights, no decision yet)

③ **Business Intelligence (BI)** — Enables better business decisions that are based on a foundation of business of business data.
